I know Laurie :~)))

– my mother was a specialist in public health :~))
and I have been posting things on and off about it.
That is why I said until [when] -- its going to happen and its very scary
but there is no risk until then and then the risk is human to human not
backyard chook in the US or UK to human

The avian flu you have in the US is the wrong strain – its not one that has
mutated like that

So was this poster trying to stir up a hornets nest ?
Very interesting that there has been NO response from the OP
Troll – me thinks

The terrible international Influenza

Yes – that is why they are all SO so scared
But there are only certain strains that are close enough

> *A couple of times in recent years, there HAS been a species jump of*

> *reportage.*

Its happening every month in Asia at the moment

Most of the cases are handling birds or handling patients who have got it
– raising poultry is HUGE HUGE business over there
Most of it is for export markets.

Yes -- but it is VITAL to remember and include that it is not the strains that hit the continental Europeans each year nor the ones that circulate around the United States seemingly endlessly – someone somewhere has it. While high welfare practises are important THESE birds are not suddenly going to pass flu to their owners.

The Asian strain is a different beast altogether.
It is

- > *In Vietnam 1,500,000 birds have been seized and destroyed this year.*

Previous years it was many many millions across Asia

- > *Are some affected regions not depopulating?*

They have already tried that but cannot afford to do it again – it very much looks like they are trying to live with it and attempting to enforce some sort of biosecurity controls

This is almost worthless if you have a look at the way these birds are reared -- completely open to the elements and interaction with wild birds and people without precautions. Hundreds of thousands of birds in small spaces often kept over water so the droppings feed fish --

Biosecurity !!!!!!!

Its a joke but the economies cannot afford to cull again -- it cannot afford the compensation or loss of income

They are bringing out all sorts of herbal concoctions -- I heard of one of fermented something with ginger and garlic !!! which was reported the other day to have improved the health of chickens who were infected with the AI so was going to be tried on a large scale!!!!!!!!!!!!!!

WHY are these birds being allowed to live

Have the WHO completely lost thier grip on world health

Its too scary for words -- but having birds in your back garden is not

> *are located where they are at risk?*

>

No --- sorry

I am saying that while the EU and the US are making righteous noises about not importing meat from China so not putting thier public at risk, that China is not where most of the meat that is imported comes from.

Thailand and the other asian countries are where most of the EU and US companies are rearing much of their meat nowadays. It arrives in our countries as prepacked meals, or portions, so they say there is no risk. These countries may not be the place it started but they are HEAVILY involved and affected.

But heaven help any western company being affected economically -- no no that would not do!!! cynic me -- never :~)

> *Oh, I have a draft web page up now for my dark eggers, visit it if you have a chance!*

the sig stripper removed it so I am including it again for you
www.mothermastiff.com

Hope you get things sorted soonest :~)
