Hi there Jill

No i've no idea how long we will be shut down and keep our poultry inside. After they found the swans in Germany we (all people in all regions with poultry) were asked to bring your birds inside or keep them onder a roof of some kind. So i used some large plastic on the roof of the pens to keep the pens covered. From monday on they will controle if you did.

I still wonder were the dead birds come from. did they wear rings, did they come from Asia because of the severe cold there and lost there way to end up in Europe. What kind of swans spieces was it?

From what I understand they are all Mute swans

these are not migratory but are driven to move when food supplies are low – like this winter there

The German, Danish, Polish deaths were all in the same [ish] area around the Baltic

It may be that infected ducks from Russia and the old USSR states where there is domestic infection had moved into the Baltic also looking for fresh food supplies and have infected this area

A few of the birds moving into continental Europe for feeding grounds explains the occurance of individuals isolated around

The real problem is in the next months of the waterfowl migrants from the south of Europe and the North of Africa who are about to start travelling over Spain, Italy, France, Holland, Germany and the rest of Eastern Europe to their breeding grounds to the North and the East up to the Arctic. These are going to the possibly infected areas :(((

With areas of infection like Turkey, Greece, Italy, Eyypt and places so far not acknoweldging it like maybe Libya some of these birds could be carriers too.

Next autumn could be very very very bad

Re: Colloidalsilver a remedie against birdflu? who can tell me more

Here in the UK our waterfowl migrants are about to leave, we get very very few of the birds above – the incoming ones are species who have not been shown in all the years to be carriers.

And why is

there birdflu in Nigeria and not in the surrounding countries. Are there sick birds we are not told about? Or is the disease imported by accident by meat suppliers?

Nigeria is most likely to be day olds / eggs from infected China – illegal exports.

Very few countries including those in Europe are able to breed and rear all the own birds for the commercial market

PLaces like Nigeria import millions of day olds / eggs each year

Even in Europe there are massinve grandparent breeding institutions where eggs for the commercial hybrids are produced. Other places hatch them. Other places rear them. Other places have them as layers

IN between they move around across borders and around the country

While biosecurity and legalities are maintained there is no threat --- where any of that breakdown there could be trouble

As i remember us was told migrating birds from Asia migrate to differend regions then those out of Europe The Europeans go to Africa the Asians to south Asia? But now there is birdflu in Nigeria out of nowere how come?

greetings xinixx

I wish you all the luck

I gather they are culling domestics in Ruegen – hopefully it will be controlled in the area of outbreak

If you see any good ideas for pens and solutions to keeping birds entertained and contained please share them with us all

There may be many of us needing it in the next few years
