Prof. Tobias <http://allserv.rug.ac.be/~mvaneech/outthere.htm>
3? if ever our earliest ancestors were savannah dwellers, we
must have been
the worst, the most profligate urinators there²

Here is a photo of a most profligate urinator on the savanna, a dead
kudu.

Like all savanna mammals kudus almost don't urinate.

Looks like the kudu could use a little more SC fat and better kidneys
in order to get away from Mr. Karoha.

So you are now claiming, even if Tobias did say such a stupid thing,
he was wrong anyway?

Humans are the profligate urinators, forgot?

Read Tobias, my boy, and don't forget to run after your kudu.

Re: Kudu runner (Re: AAT all washed up (WARNING: graphic photo))

Look at the dead kudu doughboy, it says it all. Homo is better adapted to the savanna than this guy is to the sea:

<http://www.biarms.com/PhotoAlbums/sharkATTACK1.jpg>

Looks like he needs some better swim fins.

http://www.naturalhistorymag.com/master.html?http://www.naturalhistor...1206/1206_samplings.html

"In fact, Australian Aborigines and various Native American and African groups have traditionally practiced "persistence hunting," chasing antelopes or other game in the midday heat, often for hours, until the animals overheat and collapse."

Looks like the kudu could use a little more SC fat and better kidneys in order to get away from Mr. Karoha.

AAT is
phantasy.

Savanna believers believe
that because Mr.Karoha
runs after kudus, our
ancestors were kudu
runners...

Semaw (2000:1210) " The recent cut-mark
data from Bouri indicates
that early hominids c. 2.5 Ma began
incorporating some amount of high
nutrient meat in their diet."

Why, my boy, wouldn't they butcher drowned bovids at
riverbanks?

What would that have to do with anything? Do drowned bovids mean they
were littorial? Inform a bit before spouting off.

Davidson, I. & Solomon, S. (1990) Was OH 27 the victim of a crocodile
attack?. In Solomon, S., Davidson, I. & Watson, D. (eds) Problem

Queensland, St. Lucia, Queensland. 198 – 206.

Good illustration of riverside adaptations. Thanks for the argument.

"Here's a point to consider when evaluating AAT. I did not learn this point from some academic overlord with an anti-AAT agenda; I learned it while trying to avoid becoming crocodile food in Africa. When I spent several months with a team at Lake Turkana, Kenya, investigating some of the most important early hominid sites in the world, one of our overriding concerns — while swimming, bathing, or catching fish with a net — was to watch out for crocodiles in the shallows. A croc can be on you, crush your legs in its jaws, and drag you under to drown before you have time to screech for help.

The fact that crocodiles co-existed in time and space with early hominids is a colossal blow to AAT, which does not explain what advantages early humans would have gained by spending time in crocodile-populated waters; an environment where they could not make fires, throw stones or sticks, use other tools, or have any hope whatever of escaping the most common predator. A troop of early hominids wading in a lakeshore or swampy forest would best be described as a crocodile banquet. The cute, feel-good images of babies swimming freely in a pool, shown in the AAT video, have nothing to do with the real situation of predator avoidance in Africa. Ask the Dasenich or Turkana people who live around Lake Turkana: only visiting maniacs swim in that lake." Cameron M. Smith

Think the lions just gave it to them,
doughboy? Think the lions were
making the tools out there on the hot
savanna where Homo couldn't
live?

???

You're crazy.

Lip service, only argument you ever had.– Hide quoted text –
