They lived in a different habitat. Apiths are supposed to sleep in trees, and homo not. (All nonsense, of course) But standard theory says they did not occupy the same habitat.

There is no such thing as standard theory.

The definition of savanna incorporates trees, just without enclosed canopy. So where they slept is irrelevant as to whether territories overlapped.

The issue of the kinds of trees in which Apiths slept is never discussed

Because it would be an absurd discussion. We have no data on this.

<snip>

You have no idea. IMHO snares are not far beyond the capacity of a chimp, and were quite likely in use by Apiths.

Absurd.
