They "disappear" as soon as you read them, or in any way mark them as having been seen. Which means that you'll see them exactly one time, and unless you do something special they will not be shown to you again.

Or, that is what a decent news reader will do for you.

Also, regardless of whether you read them, mark them, or whatever, each server only keeps each article for a certain amount of time. That is a configuration option for each newsgroup on a server. Indeed, sometimes it isn't the time that counts, but how much disk space is available.

Hence at some point, usually a minimum of 2-3 days, but possibly less and perhaps as much as 3-4 weeks, each article is "expired", and at that point the server removes it entirely. Only massive archives, such a google maintains, keep articles for any length of time.
