The idea is simple. A major science television broadcaster is interested in setting up a fast prototyping team dedicated to building innovative, cost effective solutions to real scientific data gathering problems.

Right now we are trying to solicit interesting ideas for projects. These will be used in an extended proposal which, if accepted, will allow us to provide an essentially free design and construction service for the life of the series. So if you have any intractable data gathering problem in need of solution we would like to hear from you.

Depending on the scope of the project we will consider building technology from scratch. Our team will be skilled in electronics, computer science, mechanical engineering, wood, plastic and metal fabrication, and they will have all the necessary tools to get the job done.

I'd really be interested in hearing your thoughts and please feel free to pass this message on to your research colleagues. If successful our service will be open to anyone with a legitimate scientific problem that needs a technical/ mechanical solution.

If you're tired of walking those geophysics transects and would like to find a way to automate the process please contact me at scitechresearch@xxxxxxxxxx with your wish list.

No... this isn't a hoax... or a scam... or a chain e-mail.
