I'm newish to astronomy and tried looking at Saturn last night with my son's Meade DS 90 or 900 something etc..., He's 10 and thinks he's put it all together right and lost the manual. I was able to see the moon very well with lots of detail, craters and stuff. When I went on to look at Saturn it looks just like it does when I look at the sky with no telescope. I don't know what to do and feel really stupid but hope someone can tell me. Thanks,
Karen Lyon

Karen,

You are very brave to have chanced being made fun of, and look– folks respond with helpful, even useful replies.

Good for you & try it again.

TBerk
currently reduced to binoculars at the moment.
