Hi all,

I'm looking for opinions and user reports of the Protostar curved vane secondary holders. I'm building an 8" f/6 with a round fiberglass tube and a wall thickness of 1/8".

I have used a Protostar 3-vane spider in the past and would definitely use one again based on it's quality and ability to hold collimation even after years of transporting the scope.

I've been out of the ATM hobby since these curved vane holders came onto the market so any info would be appreciated.
