Yes, he may be an idiot, at least in your mind, but please answer a bunch of questions for me:

- 1 Why is there an Ozone hole at the South Pole and not at the North Pole? For reference, the "ozone destroying chemicals" are all mostly used in the Northern Hemisphere and thus should be doing their work in the north rather than the south. Unfortunately, for you, this hasn't happened at all.
- 2 When are we going to be getting as warm as it was back 1000 years ago? That time period was the peak of a nice warming time when growing seasons were longer and the populace could go exploring and sustain larger populations with more and better food.
- 3 Why doesn't Greenland support the population that it supported back in Leif Erickson's time period. The Nordic expansion into Greenland couldn't be done today as the land wouldn't support that kind of a population.
- 4 Why can't the Southwest area of the US support a population like it did when all of the Indians were doing their thing way back when, and when was the great flowering of civilization in that area happening?
- 5 Why is it that despite the changes in temp that have already happened, the oceans haven't changed their basic depth? From the screams of the scaremongers, you'd expect that the problem of the oceans inundating large areas of the land mass at this time already. Please don't mix up the sinking of some land masses as being that the ocean is coming to claim the land. Most parts of the world, the docks are still at the same places and that they were in Roman times and before and the ocean is still lapping at the same height that they did back then.
- 6 Lastly, why do the penguins walk so far to get to their nesting grounds? I find it hard to believe that they'd be walking that far unless they got the imprint of that area (the area is the first dry land that they find) long ago and stubbornly keep going back to it to breed the next generation of penguins.

All of the above questions basically do deep questioning of the "current" theories of what is happening. I'll also note that it was only 30 years ago that I heard the same "scientists" screaming about an Ice Age is to be soon amongst us. They too were screaming that the world as we know it is soon to be totally destroyed. Now, which is it, hot or cold is going to wipe out humanity?

I'll also note that one of the screams by the idiots is that the world will be destroyed. As a last question, can you explain to me how the Earth would

Re: And the Earth warmers sobbed

be destroyed by the temps rising a few degrees??? When you say stupid things like this, you are talking of the Earth being completely wiped of life and the possible future of life ever happening again. Eventually (billions of years in the future) the earth will lose the ability to support life but at that point, the sun will be much larger than it is now and will be boiling the Earth's seas, eventually getting big enough to put the Earth into the Sun. Me, I wouldn't worry about things that far into the future.

--

Why do penguins walk so far to get to their nesting grounds?
