Using Windows XP, same thing happend in firefox and internet exploiter, save target as got me a zip file. Works great now that you changed it to a widdows executable. Still gives me a .zip if I try to download the Linux one.

Great program, really gives a good idea of the locations of the things I've been looking for. I knew where too look in coordinates from other programs, but didn't really have such a clear picture of their location relative to us.

Thanks for a great program.
