Does anyone have any links to astrophotos (digital/film) taken with smaller cheapo refractors in the 60–80mm range?

I would like to get an idea how such a telescope performs when properly (equatorially) guided.

There is a Yahoo group called 80f5 which, predictably, is devoted to the ubiquitous Synta ST80 achro. You can't get much mas cheapo than that.

There are several albums of photos in both the "photos" and "files" areas of the menu. Some look pretty good (e.g. the Omega Centauri at <http://ph.groups.yahoo.com/group/80f5/photos/view/6c70?b=1>) while others dramatically show the out of focus color (e.g. the Horsehead nebula in http://groups.yahoo.com/group/80f5/files/From_Chile/)

.
