Pluto Diameter is 2300 km That is Quite Big. So we cannot say it is a astroid.

Astroid has size of maximum 1-2 kms.

Although most asteroids are small, Ceres (newly redefined as a Dwarf Planet) is over 900km diameter, and there are several that are well over 100km across.

Moon is a satellite of Earth, Why as it revolves around the Earth and is big enough to have a gravity.

Pluto is a Planet as it also moves around Sun and has a Gravitational Pull for objects sitting on it.

Any heavenly body which revolves around a star and has significant gravity can be considered as a Planet.

Astroids are so small that they do not have any gravity just like other small objects on earth.

Instead of having 11 Planets Scientists disregarded Pluto as a Planet.

A Man is Tall
A Man is Short
A Man is Fat

Whatever he is he is a Man. Simmilarly A Planet whether Big or Small is a Planet. Pluto

Pluto Diameter is 2300 km That is Quite Big. So we cannot say it is a astroid.

Bye
