Hi

My girlfriend wants an slr camera for christmas. I want to borrow it and take astro photos, either standalone wide sky shots, through a zoom or attached to a telescope. Any advice? Can I do decent planetary shots with an slr and registax (akin to the Toucam pictures)?

Canon and Nikon are the best dSRLs in town. You can't go wrong with either.

Basically, you are buying into a set of lenses with replacible camera bodies.

Nikon is ahead in some Focal Lenghts and lens architectures, while Canon

is ahead in others. I have a Canon dSLR.
