incidents at Salomon,

they began issuing global email broadcasts saying that a new security package "Internet Risk Management: email facility" had been installed, and that Internet email traffic was actively being monitored.

They did so again and again.

I think they sent out a memo to everyone too.

Security incidents NEVER stopped.

Major violations occurred again and again and again and again...

I have come to realize that the number of security incidents a firm has is not related to how often they warn their employees not to send proprietary/confidential information out via email.

The number of security incidents is a function of the number of employees.

If you are a big computer-based firm (banks, brokerage, insurance etc), then you are guaranteed to have a huge amount of proprietary/confidential files flowing out of your Internet connection via email.

Even if you tell them again and again that it is monitored and they will be fired for misuse.

Even if you fire people.

Even if you prosecute them.

It appears to be just like the general population and regular crime.

All sites' management expressed confidence that repeated warnings and firings would soon stop the proprietary/confidential transfers.

It turned out to be like saying if we have a slew of laws against crime and throw many people in prison,
