I skipped the controller and just use an eyepiece heater and the DEW cigarette plug. That came to about \$40. See the Scopestuff page at:

Thanks for everyone's advice. I think I'm liking this one the best. I already have an inverter so no additional outlay there.

One other line of questions. If you have say three eyepieces at the scope you'll have the heater on the one you are using. If you pop in one of the others that have been sitting for awhile, how long does it take to clear those up? Also, have you noticed any image deterioration from using these? Of course if dew is fogging you up it probably doesn't matter since you wouldn't see anything anyway but I'm still curious.
