A recent "Defense Tech Briefs" had an article about, and an ad for, a product used to clean and protect optics. It is polymer based. You coat the lens or mirror and leave the coating in place during handling and assembly. Later, you peel off the coating to remove stuff.

The ad has a pointer to [www.photoniccleaning.com](http://www.photoniccleaning.com) where a starter kit can be had for about \$100. Not cheap, but maybe worth it for cleaning good stuff.

No, thank you.
