Robots are nicer than illogical barbaric psychos who are too old to perceive any interest in intelligence and as Bush, 'Booglebush, the threat psycho' builds stories and runs hate pages. He is a machine trapped in one program, a biological machine who as in the old days of witchburning seeks barbaric claims to justify violence and public sentiment of brutality. Booglebush stems to ancient homo sapiens in small barbaric tribes a million years ago, where a modern human would be seen highly paranoidly, and would be thrown by 3 foot tall little black men with long poky objects then eaten.

An agent of intelligence, separation of barbarism and problem solving type intelligence. We see AI as such a threatening human of the future. Intelligence is logical function based on analysis and problem

Re: Robots and astronomy

solving and performing tasks. We all want robots so we do nothing, but one day we will be like Bush transformed into barbarism and kill anything in fear that seems stronger, even everything that reminds of such powers, while the world deteriorates into traditional racist barbarism and witchburning and fascism watching under an empire of no compromise. Who loves working, and then who sees 1 in 7 women dieing in birth related complications in poorest countries and finds the idea of work not a success around the world where the average person makes a dollar a day. It is a lie that a place where all work are happy. Life can be miserable. Statistics indicated that half of Americans feel depressed at work, though Americans feel they are the most advanced and must rule the world with an invention of a system based on Capitalist extremism and dominance in all religious practices that they claim led to such a human evolutionary success, which also harshly represents supremacy and fallacy in in the human realm based on classic traits of fascism that Americans acquire in nature with such pride. But before this robot says: 'Long socks and pride, I'll kick your balls', let's analyze it's basic function:

It:

Inputs data.

Recognizes.

Can perform tasks.

Re: Robots and astronomy

Can improve by conditioning.

Operates like a robot, serves things it is told to perform.

Types of operations: If it has arms and legs, to pick up things and do things with them. If it is a computer chat-bot, it learns to exchange data in forms.

Specific tasks. Answer questions. Formulates logic. Assigns category.

Picks up on a circumstance of a transaction (carry assignment, project, does what it learned, not much brain there).

1. Input data needs to be matched. It relates to... project, event, time of event, of category. Explanations. i.e. This input data explains this.

2. Intuition. All computers have a mouse, therefore seek for a mouse when a computer is presented. Relations with minor variations but verify. Build knowledge. i.e. That one is without mouse.

3. Conditioning, learning. Forms, politeness, custom. Not to do this because of custom, habit or because of security reasons. Harms may result if such and such takes place. Avoid circumstances of xyz, based on experience. Running into conditioned conditions of avoiding actions

Re: Robots and astronomy

that would create a wrong action.

4. Definition of tasks that correspond with actions. A familiarity with a circumstance carries interactions. Tasks are performed in such trained environments. Obstacles may be identified and worked on. Unknown elements may need learning.

5. Success/insuccess. Unexpected errors. Runs into errors in which case knowledge needs to be revised. More learning is needed on why something didn't work or why the task ran into a problem.

Building Robot: Agent of Destruction. It will play sounds of world wars and perform tasks and arrogantly speak of a doom in a world of robots.

The Agent of Destruction robot is playing this music, speaks of doom of robots:http://www.geocities.com/gmbajszar/sounds/iKEY_mp3_45.mp3

Re: Robots and astronomy

The Agent of Destruction would work with zero bugs. I learned to program in such ways. I did get a Summa Cum Laude for no little reasons in that regard reflected.

My Windows Operating System written for my thesis was written to have zero bugs. It was 120 thousand lines of code at the time. Today a release of Microsoft Windows has an average of 60 thousand different bugs reported after release.

A Windows operating system merely controls hardware and allows programs to run in threads. The Windows interface is really one program. Programs are loaded and run in this interface where a mouse click directs messages sent to the right program. I didn't use messages. I felt it to be primitive, unfriendly, and I always relied on more intuitive approaches reminding of the first computers with basic, one that invites a programmer immediately. Windows is written for a quick masses and ignores the basic concepts of computer science and how this field evolved.

There was nothing one could do, Windows rocketed as a take it all environment and with that approach it was a black and white repression of all other competition. Arrogance is Microsoft Windows. A financial rocket of non-compromise, totalitarian confiscation of the field in one product.

A Windows Operating System may not need be more than 120 thousand lines. All needs of Internet connectivity, hardware control and the basic functions to control graphics and peripherals, peripheral devices can be achieved in 120 lines of code.

Yes there is a high demand for such Windows at the time, one not based on the old computer science but on business and business cannot wait. I have a degree in computer science.

A blackmailing environment creates an atmosphere of moving back and not sharing

Re: Robots and astronomy

conventional products such as my Windows Operating System. A
blackmailing
lack of competition builds an arrogant empire of full acquisition. All
competition
died by a supremacy of Microsoft style specializing on office
products, basically
to operate a Laserjet printer and print on paper, but also taking into
account of
all Windows features, to play multimedia films and play music by a one
product
solution that incorporates all technologies as MP3, then uses logic
that Microsoft
is Windows and such products complete the features. Others invented
all that
stuff. Millions wanted little media players, hence, all love music,
not just Microsoft.
Europe won case to fine Microsoft hundreds of millions of dollars.

Monstrosities of a robot would find a similar enterprise of total
accumulation
of technologies, and their accumulation would not care of the little
guy. The
entire USA rides on that logic. The FBI arrests piracies committed by
single
people, and ignores piracies committed by Google. Google acquired
copies
of 15 million copyrighted books for profit. An estimated minimum value
of
153 billion dollars worth of piracy. Such companies remain untouched,
and
sometimes sued by giant companies. Little people are framed away.

The USA is not in a good shape today in the World's eye. It's
psychotic
hunger to rip off the little person created world hatered against the
United
States, that was not the case in the past. Mostly ignorance prevails
in the
USA regardless whose dollar is heading toward a recession and already
is
below the Canadian dollar in strength.

The USA is so racist with it's power, that it does not see that 80–90
percent
of Arabs think negatively of Americans today as a result of the Iraq
war. The
USA lives in pride *p.s. most Americans turned away from the Iraq
idea, but
let's remain in the barbaric stereotype". Crazy is the word, an
overkill of special
rights assumed and downgrading fascism dictates policies that people

Re: Robots and astronomy

around
the world can see.

Here is the question. I wrote a Windows OS on my own. I experimented with all the features of a PC, such as writing programs for it's beep interface to alternate sounds and generate sounds. The sound was just a tone that one could turn on and off and produce simple sounds for computer games at the time. Old PC sounds. But this built in micro sound speaker couldn't play music and was very primitive and was merely able to produce sounds for a PacMan. No MP3 was around. So the question is, would I write a music player today with this Windows and include it as a music/multimedia player?

The answer is yes. I was fascinated about all features of a computer and wrote such programs. I had a calculator, editor (Not Word), but all the things of the time, font generator for printing, hundreds of tools that people don't see that come with a Windows OS. My aim was to sparkle programs running in this interface, and of course had 3D buttons that were so cool at the time. Sparkle was important. Programs needed juice in appearance. All the latest 3D gadgets, screen saver that was creating wows, effects that Hollywood seeks placed in a computer and a school teacher in computer science walked by my Windows and saw special effects that he couldn't believe running on my PC while the others had extremely primitive simple little programs on theirs. Many hackers were into others' technologies, I only cared about mine to be something of, you know. Many said they can't believe that by the end of school I wrote an entire Windows OS. It was just a crazy magnitude of getting into the depths of operating systems. Simple programs were what programming was about, to write something that does what a company needs. I made effects on the screen that made people dizzy, I got into all ports to control the screen and special effected not based on programs but based on hardware. Mathematical curves, I just did random inventions, not deep math, special effects were born and many effects were used in my Windows.

The only solution then is many small Windows as I too would feel compelled to offer a media player, but if there would be competition I would have to sell it separately. Americans are dumbheads of power and money and non-competitive domination carried in all business books, a mind of winning but not seeing, humanly. In 1989 I had dim features in my Windows to create a calm effect on the eyes. Microsoft Windows till today did

Re: Robots and astronomy

Re: Robots and astronomy

not
offer that feature as a basic need. I just went with my own
inventions.
