Better to spend mental energy on describing what happens and happened in actual reality (present and past) than to be bothered racking one's brain with some tenaciously perceived deficiency of the mathematical artificiality in Hamilton's rule.

If a latent genetic or epigenetic code for a suicidally self-sacrificing trait (that require a certain set of circumstances to trigger its behavioral manifestation) has come to exist within more than one individual of a population that particular genophenotype has as a fair chance of being selected for.

No flimsy esoteric logic (not even an Edserian example of such) *\*should\** be allowed to obscure this simple fact of reality.

But never mind, it is only me – skeptical author of EPT – wishing in vain, again!

P

--

Partly inspired by MAD (cold war shaming acronym), I arrived at EPT [e.g: eclectically Explanatory perversely Pert philosophical Terminology] and by concePTual lenses/tools saw/grasped how and why AEVASIVE preoccupations (personalites) normally preclude making in-dEPTh sense (of themselves).

In the acronym for Ambiadvantageously Evolved Vexed Actention Selection (System) Involving Various Endorphins, AS(S) stand for how we think/emote/behavior based on our individual repertoire of competing {by mutual inhibition} whilst cheered and booed {by current and past environmental influences} "actention modules", & AE refer to the didactic division of the Evolutionary Pressure Totality into relevant dialectic lifetime juxtapositions of:

1. Opportunity
2. Adversity - here especially SHITS [Synaptic Hibernation Imploring {naturally selective AND 'motivating' of selective unconsciousness} Traumatic {also tardily so} Situations] normally repercussively retained as CURSES type memory (aka "Pain", à la Janov)
