[snip]

IMO, the relevance of this exposition to sci.bio.evolution seems long lost — though you might see it as a brilliant flash of your own plumage before unsuspecting crowd, I consider it a show of ignorance to continually droll on about a subject in an inappropriate forum, especially when other more adequate outlets exist (sci.astro.*, sci.physics.*). In any case these trivialities are well worked out among cosmologists, e.g. the relativistic Friedman–Robertson–Walker model and space–time expansion of the Hubble sphere. Covered in many pop sci books and any intro cosmology text worth its sellback value.

[moderator's note: Hear, hear! I've been about to weigh in on this for several iterations, and now I'm doing so: This has no business in s.b.e. Move along. – JAH]
