no restrictions on domestic use of unlimited strength cryptography. That is not because the Government hasn't complained about child pornographers or terrorists or other criminals who might use it.

No, that's the reason they are giving for why U.S. companies can't EXPORT products, such as web browsers, outside U.S. territory, without compromising it with Government "Key Recovery"; i.e. made stupider and breakable.

Why such an indirect control on what they claim is a domestic problem?

Because that is how 'The Creeping Police State' works.

Slowly, bit-by-bit.

Slowly, State-by-State everyone in the U.S. is being fingerprinted.

The FBI is now advocating biometric capture of all newborns too.

This is an interesting manifesto, please take the time to read it.

Cryptography can be used to keep private: Internet traffic, such as email, and telephone conversations (PGP phone). A version of PGP phone that looks and works like a normal telephone ---- but can't be spied upon ---- would eventually become wide-spread.

It begins to change the mind-set that the Police State is inevitable.

Major references...

In the last several years intelligence operatives, specifically including SIGINT (signal intelligence) people, have started telling the story about the massive domestic use of computer monitoring software in the U.S.

Including our domestic phone calls, Internet, fax, everything.

never prefer the closes economically, appreciate them familiarly

I'm going to quote a number of articles and books; they involved talking to over 100 of these intelligence operatives.

Buy this book: "Secret Power" by Nicky Hager, ISBN 0-908802-35-8.

It describes in detail the ECHELON platform. It's one of the most important. New Zealand p
