Hi All. Just found out platinum is over \$2000 and ounce. Long time ago, I built a metal detector that was very good at finding platinum ore. At the time, I wasn't too interested in processing it and professional processors were too expensive. Things have changed. The process that was prevalent was leach with aqua regia and drop out with ammonium chloride. Is this still the state of the art or is something better available. Any information would be appreciated. Thanks in advance  
Larry
