Fred Kasner wrote:

Those things could blow up if not cared for properly and fill a lab with H₂S in nothing flat. There were several deaths at a Princeton lab when such occurred. But mostly from some courageous young faculty who went back inside to see if any students could be rescued.

When I took organic lab, we were warned that the human perception of H₂S reaches a sort of plateau, above which higher concentrations are not perceived as higher. The stuff stinks really bad at low concentrations.
