Thanks a lot, Tom, but you are ways above me.

Even if (big if) I manage to do all those measurements you insist on, what would be the practical consequence? Discard motherboard and PSU until you get products with good test values. Sorry, I'm not even trying. I bet you don't do it yourself.

My PSU was indeed cheap chinese junk. So dirty power and junky PSU may give an explanation of what happened, some building up of damages over time.

I'll get a good PSU for my new motherboard and I'll get an UPS, although you seem sceptical in this respect. Surely better than nothing?

Regards

john
