cpemma (et al):

I hate to do this to you, but could you draw the circuit with actual part numbers and values? I know that seems kind of lazy, but I haven't had any circuit or breadboard experience and an example would really help (although Toni's example was good after I printed it off from Notepad.)

I think I understand Don's, Toni's, Kunal's and your comments about using an optical device to isolate the harddrive activity signal (led drive) from a transistor that switches the 5V's current for safety's sake.

When I say I'm a noobie, I mean I am a nooooooobie!
