Why do you use less than I do?

FFS. I'll rephrase. What do
you do with all that water?

You must have some idea. That is, I'm almost sure you use hot
water for the same things I do; bathing and washing clothes and
dishes. May be I have more clothing and bathe more often?

Myself, I never actually heat water, but that's besides the point. I know noone here (except one

What do you think I do with it?

I have no idea, which is why I asked.

Re: Use of Extension Cord

I see. Since a puny 80 amp service is good enough for you, it sh
be good enough for everyone else?

It's good enough for everyone
in the UK. I find it hard to
beleive Americans use more
electricity.

You just posted that you don't have air conditioning

That doesn't use much.

Sorry, Charlie...

I take it that's an American phrase for "incorrect"?

and that you
have a gas stove and probably a gas water heater, so since I have no
gas appliances at all, I use more electricity than you do.

Than ME. But the 80 amps is the same for houses
here with electric heating.

Fine, but if you take the time to gather some facts I'm sure you'll
find that, by and large, our houses are larger than yours and
consequently cost more to heat and to cool.

That may be possible. The one good thing about America is the space. How come your poulation ha

Check into air
conditioning costs and you'll find that it takes much more energy to
do that than you thought if you think it "doesn't use much,"

It's just a big refridgerator. I'm assuming cooling the house by 10 degrees costs less than heat

You should go fuck yourself, and as far as your "evidence" goes, you
can stick it up your ass along with your "argument".

Re: Use of Extension Cord

Two in one sentence, you're getting worse.

Nope, just more efficient.

You don't need to be efficient with 200 amps.

Electricity usage will not increase dramatically.

Really? Envision someone in the US moving into a house with an 80 amp service and wanting to air condition part of it that wasn't air-conditioned before. If the capacity isn't there, it just won't happen.

So, how many amps does your airconditioner use?
