Someone that already have armed and made work the audio amplifier circuit of the book Getting Started in Electronics by Forrest Mims , p. 122.

Already I have made the following revisions:

- 1) Dual voltage supply checked
- 2) IC pins 741,386 checked (wrong 386)
- 3) Value components checked
- 4) Wiring checked

After this now I hear a strong ;hummm; but not sounds from the microphone.

Is this what I should hear or what I should hear?
Something missing?
Thanks in advance for any comment
