any idea / suggestions / comments ?

Mark

Did you say *homemade* batteries? What are you making them from? Lemons?

Well, even if you have 48V (that's a lot of lemons with nails sticking out of them), at 0.024 A, that's a whopping one Watt of power you're producing. (Ok, 1,15 W.)

You need a battery array about a thousand times bigger to run a 1kW inverter.

Why not make a one-watt inverter?

.
