Hi,

I received this TWS-434A/RWS-434 8-Bit RF Combo Package and been playing with it. I am sending and receiving using pics.

My sending signal somewhat differs with my receiving signal. I hook up both signals on the oscilloscope and I get this clear but different signal, Here is a picture I posted of the signal:

<http://www3.sympatico.ca/lerameur/>

It seems that the receiving signal cannot stay on more then 125ms, anyone can tell me why and how to fix it ?

the baud rate on the pic chip is at 2400 and the frequency if the signal is at 433mhz as mentionned above

thank you

ken

Looks to me as if the data have been encoded in some way. Check your docs for encoding implementations.

Cheers
