IME get the free one and use it as a learning tool. Once you are up to speed you will know what to look for in a simulator.

Well that was indeed my first thought. But if I am EVER going to want something more, and Visual would suffice for the long term, I would prefer to start with it. We invest a lot of time learning and individual programs, and the learning curve of changing later could make that \$98 look cheap. So I thought I would put the question to the experts, because I don't know the ultimate possibilities of either product. LT Spice might do a lot more than I would EVER need.
