What did someone say, the PIC10 and 12 series are the 555 of today?
I would just about agree, with a little programming you could do the above without all the external support parts. Use the internal RC osc and you are on your way. Just look for the edge, do the output "thing" and wait for the next edge, rising or falling, it's up to you.

Show us your code. :-) Them's the rules. If you say "use a pic" you're obligated to show how it's done. ;-)

Hear, hear!

Of course the next time you suggest a 555, you have to post a schematic as well. ;-)
