Dennis,

Okay it is good that you can progress. I thought that you may be using a different PCB package of preference and that is why you needed a netlist.

You mentioned that you had done an uninstall and re-install. Are you aware of the full clean uninstall process? P99SE uninstall leaves some files, actually a fair number of files, that can continue to mess you up after a re-install. The following process should give you an absolutely clean re-install.

Uninstall as usual through Windows remove programs facility.

Search your drive for all files \*99SE.\* and delete them.

Search your drive for \*.bpl files and delete any of the the following that still appear: vclx50.bpl, vcldb50.bpl, vcl50.bpl, Protelcomponents50.bpl, CSRTL50.bpl

Search your drive for \*.dpl files and delete any of the the following that still appear: vclx50.dpl, vcldb50.dpl, vcl50.dpl, Protelcomponents50.dpl, CSRTL50.dpl

Then you should be ready to do a clean re-install.

Cross your fingers that a clean re-install fixes the problem if you don't find some other configuration type problem. I have know several users to continue having problems after re-installing because of those files that are not deleted/replaced in the normal Windows uninstall. And the uninstall is somewhat random, I have done hundreds of re-installs on various work acquaintance's computers over 10+ years and seen that the list of files leftover after a Windows uninstall of P99SE varies from time to time. i.e. sometimes there are none of the significant \*.dpl files left, other times they are all still there.
