I wrote a semiconductor catalogue programme. Database of programme contains main parameters of components, for example: true table, pin-out, package. There're console and graphics version. Console version is useable under DOS and Linux, graphical is useable on Linux. They support more languages (English and Hungarian, now). Every programme are under development, but usable right. I'm looking for help to develop programme and database. For example: create new and update database, draw nice package-picture, translate message and help files.
