If your yahoo.com address is the only other address you need to send from, then I suggest you have a look at (free) YahooPOPs! (apparently now called YPOPS!). I use YahooPOPs! on (MS-)Windows. Your User-Agent: line indicates you are running SunOS. According to the YahooPOPs! website, it "is available on the Windows, Linux, Solaris and Mac platforms.". I don't know if the Solaris version can be used on SunOS or if SunOS offers a Linux-compatible environment, so you have to look at that part. In any case the Solaris version is distributed in source form, so may be you can just build that one on SunOS. (Just out of interest, why are you running SunOS? Isn't SunOS effectively dead? (asked the (ex-)HP-UX support person! :-)))

For details see: <<http://yahoopops.sourceforge.net>>
