Hello!

Quite a while ago we had a discussion here about methods of making front-panel markings (logo, description of various buttons etc).

Iron-on foil was mentioned, available in multitude of colours. The method of use is similar to press'n'peel. I'd like to order some of this stuff, I did save the darned links at that time, but can't find them even after googling around. I'm turning up t-shirt stuff all the time.

Anyone have an idea what this would be called precisely or where I could get it?

Ok, try this...

Make your artwork as fancy as you like. Print it on vellum paper. Mount the vellum behind a sheet of clear plexiglass. Any LED's or displays that are mounted right up against the vellum will show thru quite clearly.

Here is an example...
