I have been wondering how to wire a telephone receiver's microphone for use with a sound board. I do some audio recording with friends and have wanted to convert a telephone for this purpose for sometime now, but just recently had the gumption to do the research. While scowering the net for possibly a how-to or some information, i've only found people making or selling wire-taps for recording both sides of a conversation. I also found information on the microphone; telephones use a crystal microphone. Will I be able to just slap an xlr end on that bad boy and record away or will i need to put an amp on it? so many questions! any thoughts?

.
