If you stop to think what the video bandwidth is for hi-res computer monitors, you'll see why a wireless approach for a direct video link is doomed to failure.

All depends on what you idea of wireless is. No sweat at all at microwave frequencies...

Even at 2.4GHz, 300MHz bandwidth is a lot.
I assume at 5GHz, the guys in this band are really happy if some other use up the full band just to save a cable.

Rene
