Tried it but gave up. I'm on Win2k so I don't know if this is an OS compatibility issue. I just can't get the cursor to go where I wanted. It works fine if all you want to use are the predefined graphics but it doesn't work when I just want use the plain old keyboard. I had to use a workaround of placing a single 'line' where I wanted to type to get the cursor where I wanted. I believe that an ASCII editor should first and foremost be a text editor and have 'graphic' handling capabilities as an added feature (remember, this is me, the one who draws schematics using windows notepad).
