I have broken traces on a PCB I recently etched. Just a handful ...

I am wondering how some of you repair them. Trying to tap into your body of experience with this.

I tried soldering wirewrap from one trace to another ... but thats not very effective ... I might try pin to pin this weekend.

ALso I have seen (on some pcbs from commercial equiptment) special round shaped adhesive tape that placed on the strip repair wire to hold it to the board.

Anyone know what these are called and where I can get some?

.
