The teacher is interested, I imagine in organizing the project from beginning to end. Which mean that at least a crude apparatus must be built and functional. Believe it or not, he would like the thng to have a speech instead of relying on vibration or intensity of vibration like some commercial unit have.

I wonder if he's asked any of the intended users what *their* preferences might be. I'd think speech wouldn't be nearly as useful since it's simply so slow in providing feedback, but I wouldn't really know either.

I have been surprised that you see talking RF power & VSWR meters out there, and apparently they sell significant quantities!
