Respectfully disagree, I suspect the distance measurement is wrong. During my college days I once worked in a wooden and brick building with a 50 kilowatt 88 mhz war surplus welder. A ring of 4 power tubes in a free running oscillator. The fellow upstairs had a bunch of women welding plastic body bags under contract with it.. One quickly learned NOT to carry any copper pipe close to 3 meters in length around 20-30 feet of that beast in any direction, up, down, or sideways. Metal tables in that room sparked like mad at considerable distances. I felt sorry for the women doing the job, none spoke english etc.

Easily possible at say 60 feet. 60 yards is a bit of a fib.

.
