Hi all,

I am trying very unsuccessfully to load my code from my Flash into ram, and then jump to ram. I am finding 2 issues:

1. I can only load so many bytes to ram before the system resets.
2. when i make a jump to the code in ram space, the chip wanders off and gets lost, not knowing where it is going. I have examined ram memory through the bdm port, and I find that the instructions are there just before the jump, but it hangs up when I jump.

Any help would be greatly appreciated.
