Why do you explicitly need ethernet ..?

I wanted to make a small "IP-phone" for fun. The "phone" will need a ADC/DAC to record/replay speech, and I want to use it on an Ethernet.

So what I am looking for is a microcontroller wich can get the job done without any external ic's.

And, yes, I know that it would be a lot easier just to use my PC for this task, but again, this "phone" something I want to make for fun...

.
