Does anyone do one? Such mech info seems extremely difficult to find.
I'm looking for the kind of 'quality' mechanism found on high end CD players (but obviously I also need DVD functionality).

With a target price of 30\$, you only get plastic crap. You can always bring one to your local mechanic and have it remade from whatever material.

The target price is <\$200

Now, order ten thousand at that price, and you may get beautiful results.
With onies, you are not going to get quality for \$200.

You must be talking different uses (like broadcast units) or many years ago, at OP price i can get two each top of the line Plextor, Sony, or Pioneer brand drives with good software packages.
