hi,  
im working on a project that require long distance wire less communication up to 5 miles to deliver voice traffic. the transmitter side should be as small as possible with very low power requirements. Im looking for a starting point for this work and specifically looking for complete chips or modules which will do the job.  
If any of you have an idea please let me know.

thanks  
CMOS

And the problem with a cell phone is...?

....he is not in prison?  
.
