I can't see anything that could be mistaken for *water* though !

It's easy to test for nitroglycerine.. just give it a good shake..

Just what I was thinking, which means it's hardly likely to be used is it ? They want to blow up the aircraft not themselves on the way to the airport ! In any case, they're more likely to blow themselves up trying to make it !

You can dilute it with ethyl(?)alcohol, when you want the nitro back just add water (or leave to evaporate).
