I'd like to permanently install an FM transmitter (like used to broadcast an Ipod to a car stereo) on the bike, and install a small FM receiver on/in the helmet. However, google has finally failed me in my search for something that already exists that I can use.

That's very surprising. Wireless headphones have been around for quite a while and I'm using a pair at this moment. A Google search for 'wireless headphones' gives 35 million hits, but I notice a dearth of US sites. Are they not allowed in US?
