Hi;

Have you tried to design a difference amplifier with ordinary low cost op-amps and resistors. do you have a succesful circuit to share with high CMRR? I want to read a high DC voltage but DC voltage notr is not connected to my power supply notr, they are isolated. thats what I need to do. any other idea to read that voltage rather than a differnce amplifier? the output should be linear of course from 0 to 400V. thanks in advance...

.
