Hi all,

I am new to this and i hope to purchase a development kit for dev. microcontrollers. Due to the numerous varieties available in the market, i am lost as where i should start and what stuffs to look out for when purchasing these kits.

Whatever you buy, make sure the microcontroller has one addressing space (no 8051, no AVR, no PIC) if you want to keep your code portable. You wouldn't be the first developer who has found the platform that looked so promising in the past turns out to be a deadlock.

Bedrijven en winkels vindt U op www.adresboekje.nl

No 8051, no AVR, no PIC? What **would** you recommend, then? ;-)

I'm in a similar boat as the OP. I've found, though, that there seem to be a LOT of books on PIC development, and not all that many on the AVR. (Even my local Borders Bookstore had no fewer than 4 books on PIC projects, PIC robotics, etc.)
