- * You do work raising the free magnet.
- * The free magnet does work on the magnet on the cage.
- * Congratulations! You have successfully transferred energy from your muscles to the cage!

You do the "work" one time only, once the magnet is in position (and tied down) it will continue to repel the internal magnet.

Right -- that means your motor can only run for one cycle. If you want multiple cycles and therefore continuous output, you'll need to keep working the free magnet.

I still don't see it. Repelling magnet causes inside magnet to roll up incline on inside of wheel - wheel is unbalanced and rotates to bring the repelled (inside) magnet closer to the repelling magnet, repelling magnet causes inside magnet to roll away (continuously)

There is no net force on the bar magnet or the hamster wheel. They just sit
there in that position. Do your freshman Physics (free body diagram).
