I'm looking for a simple Windows prog that can feed a binary file out of COM1. Hyperterminal seems unable to do this despite having hordes of protocols like Z-Modem etc.

I've tried sending it as text, but I suspect that it strips out non-printing characters... or something.

Any suggestions?

Hyperterminal is full of problems. I use Docklight. Can get a free trial @  
<http://www.docklight.de/>

Teraterm Pro is free, and does everything I've needed for a decade. You can even get a SSH extension for it. (Free)

I've downloaded it but not run it yet.  
Is it XP compatible, and can it do 115,000 baud?
